DYNAMICS OF AUTOMATA UNDER DIFFERENT UPDATE SCHEDULES

PH.D. THESIS

AUTHOR: STEPHANIE MACLEAN KONGA

ADVISOR: ERIC GOLES CHACC

COADVISOR: MARCO MONTALVA MEDEL

PhD. in Engineering Complex Systems
Santiago, 2019

This thesis was guided by Eric Goles and Marco Montalva, who undoubtedly have been a tremendous contribution in the development and evolution of this PhD.

This thesis was possible thanks to the fellowship program Becas Doctorado Nacional from CONICYT 21160688 (S.M.) and the Ministerio de Educación de Chile, and the contribution of ECOS Project ECOS C16E01 (E.G.), FONDECYT Iniciación 11150827 (M.M.) and Programa Regional STIC-AmSud (CoDANet) 19-STIC-03.

Y poderoso es Dios para hacer que abunde en vosotros toda gracia, a fin de que, teniendo siempre en todas las cosas todo lo suficiente, abundéis para toda buena obra.
2 Corintios 9:8

Abstract

In this thesis our main interest is focused specifically on the dynamics of cellular automata. Dynamics will be addressed by the *invariance* of the automaton, and in some cases invariance will be addressed by its *reversibility*. Our concept of invariance will be considered under the set of attractors of the automaton, i.e. it's periodic configurations. This concept suggests to question the *robustness* of the automaton, this is, the stability of the behaviour regardless external disturbances, such as different update schedules. This is important in dynamical systems, in order to determine and prove strong properties that are invariant under structural modifications.

More precisely, we have studied the *block invariance* and *attractor invariance* of the elementary cellular automata, Section 3.1 and 3.2 respectively, and *invariance* of linear rules with radius 2, Section 4.2. On the one hand, we have studied 11 conjectures about block invariance, that were previously established in [7]. We were able to prove 9 of them and refute the other 2 left. Also, for all 256 elementary cellular automata we established equivalences in between them by means of the configurations of their set of attractors. In the case of attractor invariance we managed to characterize the set of attractor of the elementary cellular automata rules under sequential update schedules, so to establish equivalences (classes) in between these rules by means of the configurations of their set of attractors. We have proven 2 of these classes, leaving the rest of them as future work. On the other hand, we were able to characterize the update schedules for which the linear rules 90 and 150 are invariant, and the same was done for linear rules with radius 2. The key tool to prove invariance for linear rules was the study of the reversibility of each rule.

Due to this work we have published two articles, [8, 11].

Contents

Abstract	i
Contents	ii
1 Introduction	1
1.1 Motivation and goals	4
1.2 Outline of the thesis	4
2 Background on Cellular Automata	7
2.1 Elementary cellular automata	9
2.2 Linear cellular automata	12
2.2.1 Matrix system associated to a linear rule updated by an irreducible update schedule	13
2.2.2 Reversibility as a tool to study the block invariance	15
3 Invariance in Elementary Cellular Automata	17
3.1 Block invariance in ECA	17
3.1.1 Solving the conjectures	20
3.2 Attractor invariance in ECA	34
3.2.1 Classes of π -invariant rules, which are attractor equivalent	34
3.2.2 Classes of not π -invariant rules, which are attractor equiv- alent	38
4 Invariance and reversibility of linear rules	41
4.1 Invariance of rules 90 and 150	43
4.2 Invariance of linear rules with radius 2	45
4.2.1 Linear rules 11100 and 11000	46
4.2.2 Linear rules 11111 and 11011	53
4.2.3 Linear rules 11110 and 11010	58
4.2.4 Linear rules 10101 and 10001	64
4.2.5 Linear rules 11101 and 11001	67
4.2.6 Linear rules 10110 and 10010	72
4.2.7 Linear rule 10100	76
5 General Conclusions	79
